Unit 2: Selection and Iteration Name: _____
Activity: Create Your Own Conditional

Problem: Your task is to write a Java program that asks the user for input and evaluates it using at least one nested if statement and at least three else-if conditions. Complete this worksheet to plan and reflect on your program. You will submit this at the end of class today. The program you code in the Sandbox will be submitted in the Google Classroom.

Your program must follow these guidelines:

- Come up with a real-world scenario that requires decision-making.
- Your program must ask the user for input. (For example, an age, a test score, a favorite color, etc.)
- At least one variable in your if-else if chain must be nested inside another condition.
- You must handle at least four different cases using a chain of if-else if statements.
- Your program should print an appropriate message based on the user's input.

Planning Your Program

1) What will your program do?

2) What values will the user enter?

3) What will your program display as the output?

4) What conditions will your check for?

5) In the space below, create a visual for your program. You can use pseudocode, flowcharts, or any visual graphic organizer than lets you layout your plan.

Coding Your Program

Once you have a plan in place, go to the Sandbox and start coding your program! You will submit the URL of your program to our Google Classroom.

Reflecting on Your Program

Answer the reflection questions below after you have completed your program.

1. Explain your program's logic. How do the conditions and nested if-else statements determine the output?

2. What was the most challenging part of writing your program? How did you solve it?

3. If you had an error, what was it and how did you fix it? If you didn't have an error, what part of your program were you most confident about?
