Unit 1 – Using Objects and Methods Name: **KEY**
HW 2

1) Given the following code segment:

```
int age = 16;
String name = "Cindy";
```

Write a line of code that correctly prints: Cindy is 16 years old.

```
System.out.println(name + " is " + age + " years old. ");
```

2) Match the variables with the values that they can hold.

C	`String value;`	A. 5
A	`int count;`	B. 3.5
B	`double num;`	C. "Science is fun"
D	`boolean thing;`	D. false

3) There are 3 mistakes in the class below. Circle or highlight them and explain what the mistake is and how to fix it.

There should be quotations around "Welcome to the show."

There should be quotations around "Are you ready to start?"

You cannot put a decimal into an integer variable. Make the variable a double.

```
public class Example
{
     public static void main(String[] args)
     {
          System.out.println(Welcome to the show.);
          String question;
          question = Are you ready to start?;
          System.out.println(question);
          int amount = 3.5;
          System.out.println("There will be " + amount + " shows.");
          double cost = 5;
          System.out.println("The show will cost " + cost);
     }
}
```

4) Place a “T” for a true statement and “F” for a false statement on the lines below.

T a) All Java methods must be contained in a class.

F b) The `static` keyword in the main method is optional.

T c) An integer can be stored in a double variable.

F d) A double can be stored in an integer variable.

T e) A class can start with either an uppercase or lowercase letter.

F f) A String is a primitive data type.

T g) Declaring a variable is allocating space in memory for it, but not giving it a value.

T h) Every statement in Java must end in a semicolon.
